

Retail Giant Sales Forecasting

Global Mart Sales and Quantity Forecasting

Sohini Chaudhuri

Business Requirement

1. Store Sales & Operations Manager wants to finalize a plan for 6 months to manage revenue & inventory
2. The store caters to 7 different Market under 3 major Segments
3. Forecast of Sales & Quantity for the next 6 months is required for the 2 most consistently profitable Market segments

Data Understanding & Preparation(2)

- The month wise aggregated Profit (AggProfit) for each subset is calculated
- Coefficient of variation (CoV) = $\text{sd}(\text{AggProfit}) / \text{mean}(\text{Profit})$ is tabulated below

	Africa	APAC	Canada	EMEA	EU	LATAM	US
Consumer	1.319585	0.6321323	1.395312	2.188271	0.6243052	0.6614828	1.012390
Corporate	1.776105	0.6980869	1.552775	4.467102	0.7638072	0.8111217	1.002409
Home Office	1.789996	1.0459784	2.243461	5.880747	1.1165073	1.1756978	1.096147

- The most consistently profitable segments correspond to the ones with least CoV
 1. EU Consumer
 2. APAC Consumer
- Time Series corresponding to EU Consumer Sales, EU Consumer Quantity, APAC Consumer Sales and APAC Consumer Quantity are created for Model

Modelling EU Consumer Sales

- The timeseries is separated into training and testing data. The last six months data is used to evaluate the forecast made by model
- Both classical decomposition and autoarima methods are used and their accuracies are compared using MAPE
- Holt Winter's Method is used for smoothening the data.
 - Various alpha values are tried
- The smoothened series is modelled for seasonality and trend using multiplicative, sinusoidal-polynomial expression
 - Various degrees of polynomial and coefficient in sine and cosine are tried

Modelling EU Consumer Sales – Classic Decomposition

HoltWinters smoothing . Choosing $\alpha=0.3$ (green)

MAPE= 26.82

Best model

Multiplicative Models

Imfit <- lm(Sales~ (sin(0.5*Month) *poly(Month,2) + cos(0.5*Month)) * poly(Month,2), data=smootheddf)

Imfit <- lm(Sales~ (sin(0.5*Month) *poly(Month,3) + cos(0.5*Month)) * poly(Month,3), data=smootheddf)

Imfit <- lm(Sales~ (sin(0.8*Month) *poly(Month,3) + cos(0.8*Month)) * poly(Month,3), data=smootheddf)

Additive Model

Im(Sales~ (sin(0.8*Month) + poly(Month,3) + cos(0.8*Month)) , data=smootheddf)

Modelling EU Consumer Sales – Classic Decomposition

Global Prediction

Local Prediction = Actual Time series – Global Prediction

Modelling EU Consumer Sales – Classic Decomposition

ACF and PACF plots show that data has no auto regressive components. Using autoarima on the Local Prediction , we find that it is ARIMA(0,0,0). Here also, we can conclude that there is no auto regressive component .Residual series is White Noise as confirmed by KPSS and Dickey Fuller tests

Model Evaluation EU Consumer Sales – Classic Decomposition

Table with actual and forecasted values

Month	Actual	Forecasted
43	31967.69	31387.85
44	68951.72	32906.64
45	52328.68	35202.61
46	36348.31	37825.45
47	63218.71	40220.44
48	63178.60	41882.25

Forecasting for next 6 months and measuring accuracy gave **MAPE=26.82** which is low and hence a good model with classic decomposition

Modelling EU Consumer Sales

- Using Auto Arima Method
 - ARIMA(2,1,0)
 - log likelihood=-512.5
 - AIC=1031 AICc=1031.56 BIC=1036.55
- MAPE= 36.81

MAPE using classical decomposition method using model $\sin(0.5 * \text{Month}) * \text{poly}(\text{Month}, 3) + \cos(0.5 * \text{Month}) * \text{poly}(\text{Month}, 3)$ was 26.82 and a better model

Modelling EU Consumer Quantity - Classic Decomposition

Holts Winter smoothing, Choosing alpha = 0.3

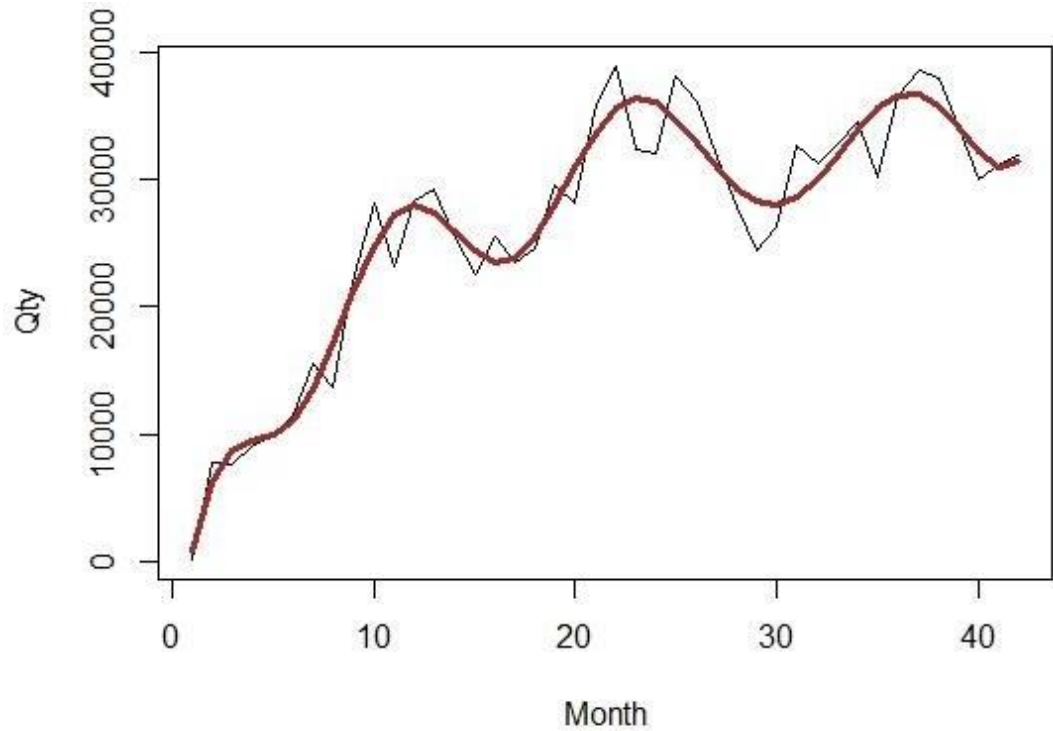

Best Model

- $\text{lm}(\text{Qty} \sim \sin(0.5 * \text{Month}) * \text{poly}(\text{Month}, 2) + \cos(0.5 * \text{Month})) * \text{poly}(\text{Month}, 2) \dots$
- $\text{lm}(\text{Qty} \sim (\sin(0.5 * \text{Month}) * \text{poly}(\text{Month}, 3) + \cos(0.5 * \text{Month})) * \text{poly}(\text{Month}, 3) \dots$
- $\text{lm}(\text{Qty} \sim \sin(0.8 * \text{Month}) * \text{poly}(\text{Month}, 2) + \cos(0.8 * \text{Month})) * \text{poly}(\text{Month}, 2) \dots$
- $\text{lm}(\text{Qty} \sim (\sin(0.8 * \text{Month}) + \text{poly}(\text{Month}, 3) + \cos(0.8 * \text{Month})) \dots$

Modelling EU Consumer Quantity - Classic Decomposition

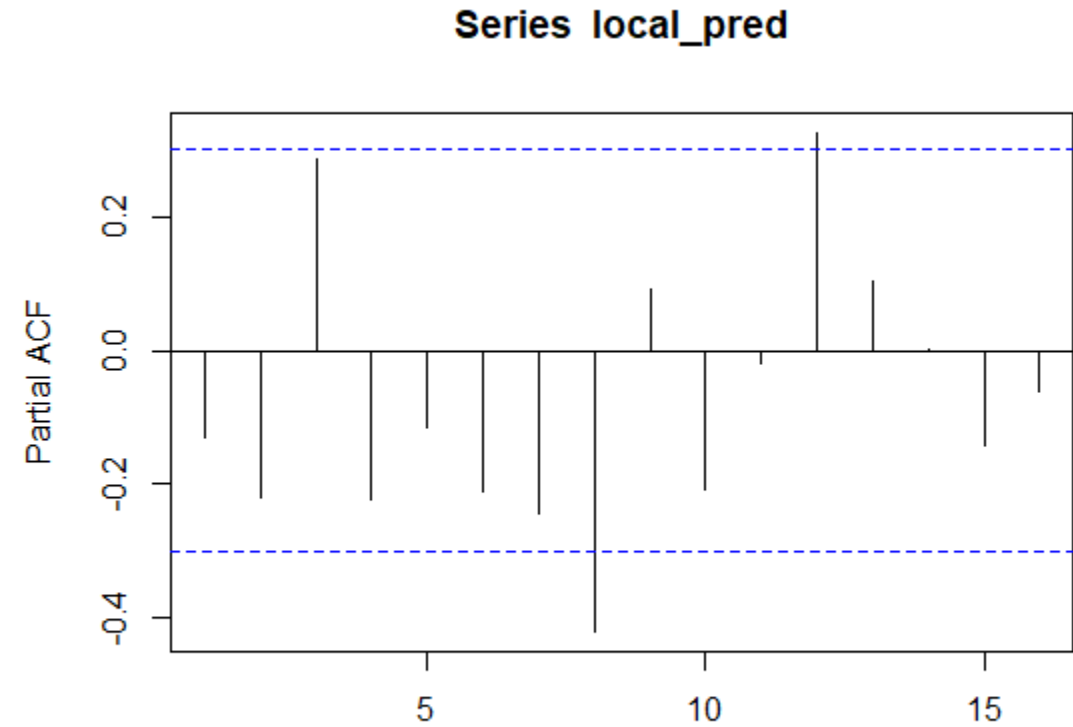

Global Prediction

Local Prediction = Actual Time series – Global Prediction

Modelling EU Consumer Quantity - Classic Decomposition

ACF and PACF plots show that data has no auto regressive components. Using `auto.arima` on the Local Prediction , we find that it is $ARIMA(0,0,0)$. Here also, we can conclude that there is no auto regressive component. Residual series is White Noise as confirmed by KPSS and Dickey Fuller tests

Model Evaluation EU Consumer Quantity - Classic Decomposition

Forecasting gave MAPE of 32.79

Table with actual and forecasted Quantity values

Month	Actual	Forecasted
43	423	421.9609
44	932	434.0731
45	688	442.0687
46	459	440.9714
47	843	429.8014
48	905	412.5824

Modelling EU Consumer Quantity - ARIMA

- Using AutoArima Method
 - ARIMA(2,1,0)
 - log likelihood=-261.9
 - AIC=529.8 AICc=530.44 BIC=534.95
 - MAPE=31.56

In this case MAPE is 31.56, it is comparable with the model with classical decomposition
Model used for forecast : $\sin(0.5 * \text{Month}) * \text{poly}(\text{Month}, 3) + \cos(0.5 * \text{Month}) * \text{poly}(\text{Month}, 3)$

Modelling APAC Consumer Sales - Classic Decomposition

Holts Winter smoothing, Choosing $\alpha = 0.3$

Best Model

- $\text{lm}(\text{Sales} \sim (\sin(0.5 * \text{Month}) * \text{poly}(\text{Month}, 2) + \cos(0.5 * \text{Month})) * \text{poly}(\text{Month}, 2) \dots$
- $\text{lm}(\text{Sales} \sim (\sin(0.5 * \text{Month}) * \text{poly}(\text{Month}, 3) + \cos(0.5 * \text{Month})) * \text{poly}(\text{Month}, 3) \dots$
- $\text{lm}(\text{Sales} \sim (\sin(0.8 * \text{Month}) * \text{poly}(\text{Month}, 3) + \cos(0.8 * \text{Month})) * \text{poly}(\text{Month}, 3) \dots$
- $\text{lm}(\text{Sales} \sim (\sin(0.8 * \text{Month}) * \text{poly}(\text{Month}, 2) + \cos(0.8 * \text{Month})) * \text{poly}(\text{Month}, 2) \dots$

Modelling APAC Consumer Sales - Classic Decomposition

Global Prediction

Local Prediction = Actual Time series – Global Prediction

Modelling APAC Consumer Sales - Classic Decomposition

ACF and PACF plots show that data has no auto regressive components. Using `auto.arima` on the Local Prediction , we find that it is $ARIMA(0,0,0)$ Here also, we can conclude that there is no auto regressive component. Residual series is White Noise as confirmed by KPSS and Dickey Fuller tests

Model Evaluation APAC Consumer Sales - Classic Decomposition

Forecasting gave a MAPE of 20.622

Table with actual and forecasted Quantity values

Month	Actual	Forecasted
43	36524.30	49502.70
44	63521.77	56841.03
45	44477.27	63338.85
46	77379.83	67101.51
47	82286.36	66816.26
48	60292.13	62218.53

Modelling APAC Consumer Sales -ARIMA

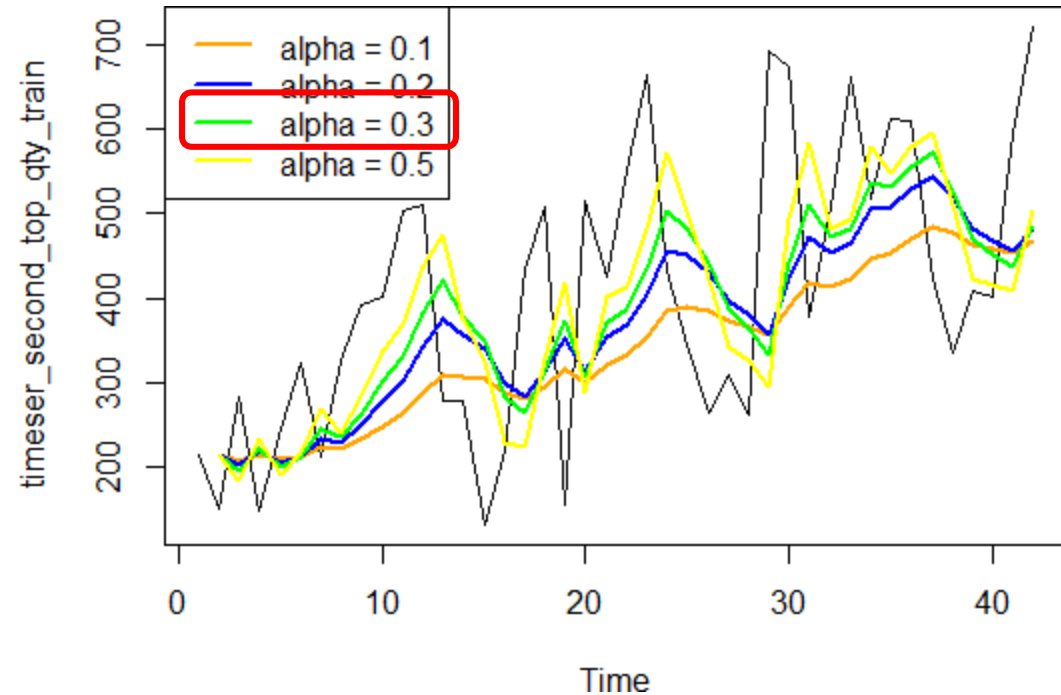

- Using the AutoArima Method
 - ARIMA(0,1,1)
 - log likelihood=-515.41
 - AIC=1034.83 AICc=1035.1
 - BIC=1038.53
 - MAPE= 45.53

In this case, classical decomposition method gives a much better MAPE of 20.622

Model type used : $\sin(0.5 \cdot \text{Month}) \cdot \text{poly}(\text{Month}, 2) + \cos(0.5 \cdot \text{Month}) \cdot \text{poly}(\text{Month}, 2)$

Modelling APAC Consumer Quantity – Classic Decomposition

Holts Winter smoothing .Choosing Alpha=0.3

Best
Model

$\text{lm}(\text{Sales} \sim (\sin(0.5 * \text{Month}) * \text{poly}(\text{Month}, 2) + \cos(0.5 * \text{Month})) * \text{poly}(\text{Month}, 2) \dots$

$\text{lm}(\text{Sales} \sim (\sin(0.5 * \text{Month}) * \text{poly}(\text{Month}, 3) + \cos(0.5 * \text{Month})) * \text{poly}(\text{Month}, 3) \dots$

$\text{lm}(\text{Sales} \sim (\sin(0.8 * \text{Month}) * \text{poly}(\text{Month}, 2) + \cos(0.8 * \text{Month})) * \text{poly}(\text{Month}, 2) \dots$

$\text{lm}(\text{Sales} \sim (\sin(0.8 * \text{Month}) * \text{poly}(\text{Month}, 3) + \cos(0.8 * \text{Month})) * \text{poly}(\text{Month}, 3) \dots$

Modelling APAC Consumer Quantity – Classic Decomposition

Global Prediction

Local Prediction = Actual Time series – Global Prediction

Modelling APAC Consumer Quantity – Classic Decomposition

ACF and PACF plots show that data has no auto regressive components. Using `auto.arima` on the Local Prediction, we find that it is $ARIMA(0,0,0)$. Here also, we can conclude that there is no auto regressive component. Residual series is White Noise as confirmed by KPSS and Dickey Fuller tests

Model Evaluation - Classic Decomposition

Table with actual and forecasted Quantity values

Month	Actual	Forecasted
43	377	541.0292
44	816	609.7819
45	658	672.7776
46	885	712.4482
47	829	716.3389
48	833	681.3039

Forecasting gave a MAPE of 20.38 which is low and hence accurate forecast

Modelling APAC Consumer Quantity -ARIMA

- Modelling Using Auto Arima
 - ARIMA(0,1,1)
 - log likelihood=-303.76
 - AIC=611.53 AICc=611.8 BIC=615.23
 - MAPE= 33.918

In this case classical decomposition gives a better forecast as its MAPE = 20.38

Model is of type $\sin(0.5 \cdot \text{Month}) \cdot \text{poly}(\text{Month}, 2) + \cos(0.5 \cdot \text{Month}) \cdot \text{poly}(\text{Month}, 2)$

SUMMARY - Sales

Top 2 Profitable(consistent) Market & Segment

1. EU - Consumer
2. APAC - Consumer

Consumer products Quantity forecast is obtained from the model for EU & APAC Markets

Forecast under 3 product categories is also mentioned based on the below approximate % percentage observed

EU

- Technology – 30% of Forecast
- Office Supplies – 60% of Forecast
- Furniture – 10% of Forecast

APAC

- Technology – 20% of Forecast
- Office Supplies – 60% of Forecast
- Furniture – 20% of Forecast
